Art Unit: 2687

DETAILED ACTION

Claim Rejections - 35 USC § 102

- 1. The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:
 - (e) the invention was described in (1) an application for patent, published under section 122(b), by another filed in the United States before the invention by the applicant for patent or (2) a patent granted on an application for patent by another filed in the United States before the invention by the applicant for patent, except that an international application filed under the treaty defined in section 351(a) shall have the effects for purposes of this subsection of an application filed in the United States only if the international application designated the United States and was published under Article 21(2) of such treaty in the English language.
- 2. Claims 1 and 10 are rejected under 35 U.S.C. 102(e) as being anticipated by **Zimmerman et al** (US Patent No. 6785252).
- 3. Regarding **claim 1**, Zimmerman teaches a method of allocating uplink resources, comprising: estimating traffic in an uplink; and allocating resources based on said step of estimating (performs an estimate of the uplink traffic to allocate uplink bandwidth, Col. 24, lines 26-29).
- 4. Regarding **claims 10**, it is an apparatus claim corresponding to claim 1. Therefore, it is rejected for the same reasons as claim 1 respectively (see claim 1 above).

Art Unit: 2687

Claim Rejections - 35 USC § 103

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

- (a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.
- 6. Claims 2 and 11 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al** (US Patent No. 6785252) in view of **Wallentin et al.** (US Publication 2005/0013287).
- Regarding claim 2, Zimmerman teaches a method according to claim 1 (see claim 1 above). However, Zimmerman fails to expressly teach that the step of associating the traffic with a bulk TCP uplink data transfer, and estimating the traffic in the uplink for a given transfer block to be identical as for a previous transfer block. In an analogous art, Wallentin teaches a type of bulk TCP traffic, which is known in the art to be bursty and asymmetric (Col. 4, paragraph 36). Furthermore, Wallentine discloses a method of using the content of received data packets sent in the uplink or downlink to make predictions of the expectable traffic on the uplink or downlink (Col. 3, paragraph 33), thereby suggesting that uplink traffic can be estimated based on the previous sent data. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to provide a method of bandwidth allocation of an uplink of bulk TCP traffic type to be based on the estimation of the previous data transfer block to utilize radio resource more efficiently.

Art Unit: 2687

8. Regarding **claims 11**, it is an apparatus claim corresponding to claim 2. Therefore, it is rejected for the same reasons as claim 2 respectively (see claim 2 above).

- 9. Claims **3 and 12** are rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al** (US Patent No. 6785252) in view of **Wallentin et al.** (US Publication 2005/0013287) in further view of **Love et al.** (US Publication 2004/0219917).
- 10. Regarding claim 3, Zimmerman teaches a method according to claim 1 (see claim 1 above). However, Zimmerman fails to teach a step of associating the traffic with a bulk TCP downlink data transfer, and wherein the estimating step comprises estimating the traffic in the uplink for a given transfer block to be an acknowledgement of the traffic in a downlink. In an analogous art, Wallentin teaches that one of the expected major protocol is TCP which can have two type of data: "interactive" or "background" which is also known in the art as bulk TCP since it is characterized as bursty and asymmetric (Col. 4, paragraph 36). Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to have a bandwidth allocation that account for the characteristics of bulk TCP to have a more robust and versatile allocation scheme that can handle bulk TCP data. In addition, Love teaches a method of making use of the acknowledgement to determine the uplink transmission activity (Col. 7, paragraph 64). It is also known in the art, that in TCP transmission, ACK is used to detect congestion and thus the system stops sending more packets if ACK is not received. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to estimate the uplink traffic based on the acknowledgement of the downlink traffic to increase resource efficiency.

Art Unit: 2687

11. Regarding **claims 12**, it is an apparatus claim corresponding to claim 3. Therefore, it is rejected for the same reasons as claim 3 respectively (see claim 3 above).

- 12. Claims **4 and 13** are rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al** (US Patent No. 6785252) in view of **Wallentin et al.** (US Publication 2005/0013287) in further view of **Haartsen** (US Publication 2005/0048985).
- 13. Regarding **claim 4**, Zimmerman teaches a method according to claim 1 (see claim 1 above). However, Zimmerman fails to teach a step of associating the traffic with an interactive TCP data transfer, and wherein the step of estimating comprises estimating the traffic in the uplink to be identical to the traffic in a downlink. In an analogous art, Wallentin teaches that one of the expected major protocols is TCP, which can have two type of data: "interactive" or "background". (Col. 4, paragraph 36). Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to have a bandwidth allocation that account for the characteristics of bulk TCP to have a more robust and versatile allocation scheme that can handle interactive TCP data. In another analogous art, Haartsen teaches a method of radio resource management where the bandwidth in the uplink is identical to the bandwidth in the downlink (Col. 4, paragraph 42). Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to modify the bandwidth allocation to estimate the uplink traffic to be the same as the downlink to make a more real-time based and flexible bandwidth allocation algorithm.
- 14. Regarding **claims 13**, it is an apparatus claim corresponding to claim 4. Therefore, it is rejected for the same reasons as claim 4 respectively (see claim 4 above).

Art Unit: 2687

15. Claims **5 and 14** are rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al** (US Patent No. 6785252) in view of **Love et al.** (US Publication 2004/0219917) in further view of **Patel** (US Patent No. 6697378).

- 16. Regarding **claim 5**, Zimmerman teaches a method according to claim 1 (see claim 1 above). Zimmerman fails to teach a step of estimating comprises estimating the traffic in the uplink to include an acknowledgement of the traffic in a downlink. In an analogous art, Love teaches a method of making use of the acknowledgement to determine the uplink transmission activity (Col. 7, paragraph 64). In addition, Patel also disclose that TCP uses window-based flow control in acknowledgement to advertise how much space the receiver has available for additional data (Col. 1 lines 60-67). Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to modify the estimating traffic step to include an acknowledgement of the traffic of the downlink to provide a more efficient use resource.
- 17. Regarding **claims 14**, it is an apparatus claim corresponding to claim 5. Therefore, it is rejected for the same reasons as claim 5 respectively (see claim 5 above).
- 18. Claims 6 –7 and 15 -16 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al** (US Patent No. 6785252) in view of **Haartsen** (US Publication 2005/0048985).

Art Unit: 2687

19. Regarding **claim 6**, Zimmerman teaches a method according to claim 1 (see claim 1 above). However, Zimmerman fails to teach the step of estimating comprises estimating the uplink based upon a downlink traffic. In another analogous art, Haartsen teaches a method of radio resource management where the bandwidth in the uplink is identical to the bandwidth in the downlink (Col. 4, paragraph 42). Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to modify the bandwidth allocation to estimate the uplink traffic to be based on the downlink to make a more real-time based and flexible bandwidth allocation algorithm.

- 20. Regarding **claim 7**, Zimmerman and Haartsen teach a method according to claim 6 (see claim 6 above). Haartsen further teaches the step of estimating comprises estimating an uplink traffic to be an identical as a downlink traffic (bandwidth in the uplink is identical to the bandwidth in the downlink, Col. 4, paragraph 42). Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to modify the bandwidth allocation to estimate the uplink traffic to be the same as the downlink to make a more real-time based bandwidth allocation algorithm.
- 21. Regarding **claims 15 and 16**, it is an apparatus claim corresponding to claim 6 and 7 respectively. Therefore, it is rejected for the same reasons as claim 6 respectively (see claim 6 and 7 above).
- 22. Claims **8, 9, 17 and 18** are rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al** (US Patent No. 6785252) in view of **Haartsen** (US Publication 2005/0048985) in further view of **Patel** (US Patent No. 6697378).

Art Unit: 2687

23. Regarding **claim 8**, Zimmerman and Haartsen teach a method according to claim 6 (see claim 6 above). However, they fail to teach a step of estimating an uplink traffic to be an acknowledgement of the downlink traffic. In the same field of endeavor, Patel also disclose that TCP uses window-based flow control in acknowledgement to advertise how much space the receiver has available for additional data (Col. 1 lines 60-67). Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to estimating the uplink traffic to be an acknowledgement of the traffic of 0the downlink to provide a more efficient usage of resource.

- Regarding **claim 9**, Zimmerman and Haartsen teach a method according to claim 6 (see claim 6 above). However, they fail to teach a step of estimating comprises estimating an uplink traffic to be identical as a downlink traffic together with an acknowledgement of the downlink traffic. In the same field of endeavor, Patel also disclose that TCP uses window-based flow control in acknowledgement to advertise how much space the receiver has available for additional data (Col. 1 lines 60-67). In addition, it is known in the art that ACK can be sent by both uplink or downlink in TCP transmissions. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to estimate the uplink traffic to include both the ACK and data of the downlink to provide a more accurate bandwidth allocation scheme.
- 25. Regarding **claims 17-18**, they are apparatus claims corresponding to claims 8-9 respectively. Therefore, they are rejected for the same reasons as claims 8-9 respectively (see claims 8-9 above).

Art Unit: 2687

26. Claims **19** is rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al** (US Patent No. 6785252) in view of **Cave** (US Patent No. 6868273).

- 27. Regarding **claims 19**, Zimmerman teaches all the limitations according to claim 10 (see claim 10 above). However, he fails to teach a mobile communication system in which the estimating means uplink and an uplink allocation resource are provided in a radio access network. In analogous art Cave teaches that a RAN is used to perform call admission control for allocation evaluation. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to perform the estimating and allocation of the uplink resource at the RAN.
- 28. Claims **20** is rejected under 35 U.S.C. 103(a) as being unpatentable over **Zimmerman et al.** (US Patent No. 6785252) in view of **Wallentin et al.** (US Publication 2005/0013287).
- 29. Regarding **claims 20**, Zimmerman teaches all the limitations according to claim 10 (see claim 10 above). However, he fails to teach specifically a mobile communication system in which the estimating means uplink and an uplink allocation resource are provided in a serving General Packet Radio Service support node. However, Wallentin teaches a method of improving efficient usage of radio network resources (abstract), which may use any type of traffic control nodes, which can be a serving support GPRS node [**0044**]. Therefore, it would have been obvious to a person of ordinary skill in the art at the time of the invention was made to estimate the bandwidth allocation at the SGSN.

Art Unit: 2687

Citation of Prior Art

1. The prior art made of record and not relied upon is considered pertinent to applicant's

disclosure.

Chapman et al. (US Patent Number 6028842) discloses a method of dynamic traffic

conditioning.

Any inquiry concerning this communication or earlier communications from the examiner

should be directed to Dung Lam whose telephone number is (571) 272-6497. The examiner

can normally be reached on M - F 8-5pm.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's

supervisor, Lester Kincaid can be reached on (571) 272-7922. The fax phone number for the

organization where this application or proceeding is assigned is 703-872-9306.

Information regarding the status of an application may be obtained from the Patent

Application Information Retrieval (PAIR) system. Status information for published applications

may be obtained from either Private PAIR or Public PAIR. Status information for unpublished

applications is available through Private PAIR only. For more information about the PAIR

system, see http://pair-direct.uspto.gov. Should you have questions on access to the Private

PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free).
